

A study of flight delays from NY

by Mihai Munteanu

Contents

1. What is the data?
2. Main goal
3. Let the data speak
4. Conclusions

The data

~ 330 000 flights
leaving from 3 NY
airports in 2013

Total flights by origin
origin

EWB	145179
LGA	100663
JFK	72154

together with hourly
weather data for the
3 airports

The problems with the data

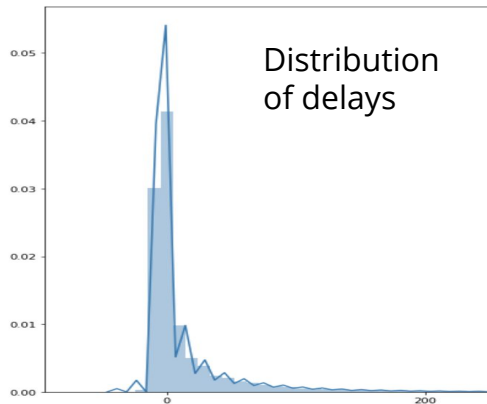

Weird outliers in the data:

	departure	scheduled_departure	flight_id	departure_delay
151	848	1835	3944	-587
7029	641	900	51	-139
8190	1121	1635	3695	-314
56746	603	1645	2042	-642

- Did Flight 3695 depart 5h early or 19h late?
- Are {'SJU', 'ERW', 'PSE', 'BQN', 'STT'} actually airports?
- The normal stuff: missing departure/arrival data, weather conditions data

Questions

Main Goal: Figure out what influences flight delays and how

1. Do longer flights have longer delays than shorter flights?
2. Do evening flights have longer delays than morning flights?
3. Does big airport imply more crowding and hence longer delays?
4. Are some airlines more efficient than others in dealing with delays?
5. Is weather the main culprit for delays?
6. Any other questions/curiosities you have?

Let the data speak

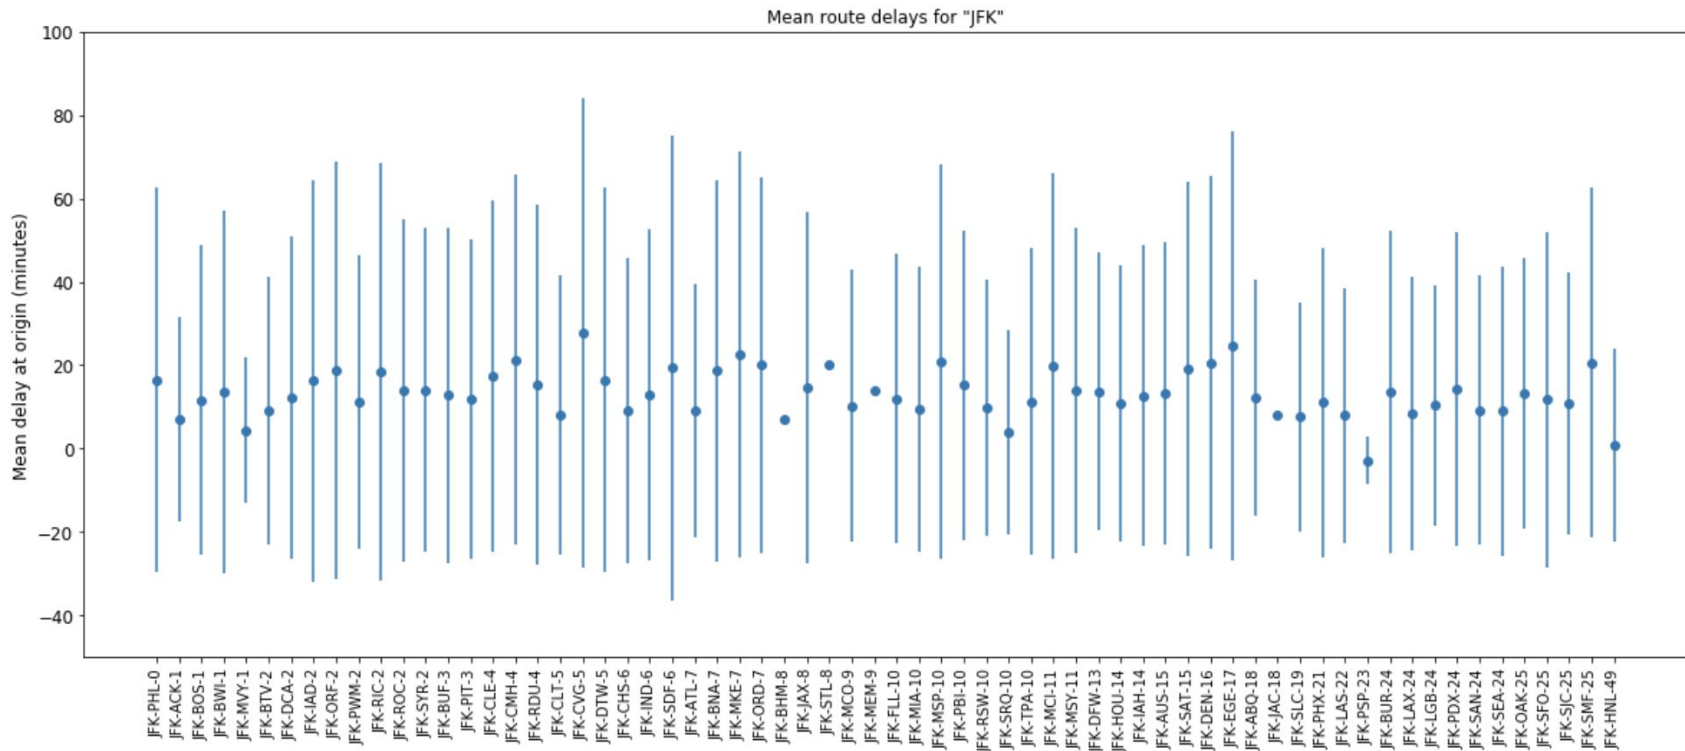

Distance of a flight does not have a significant impact on **delays**.

Percentages of delayed flights by origin
origin
EWR 0.434698
JFK 0.381919
LGA 0.331353
dtype: float64

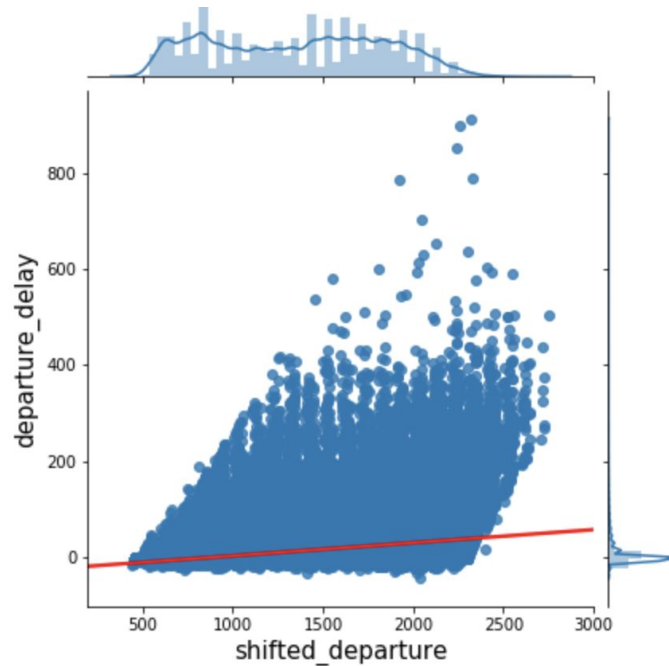

Let the data speak

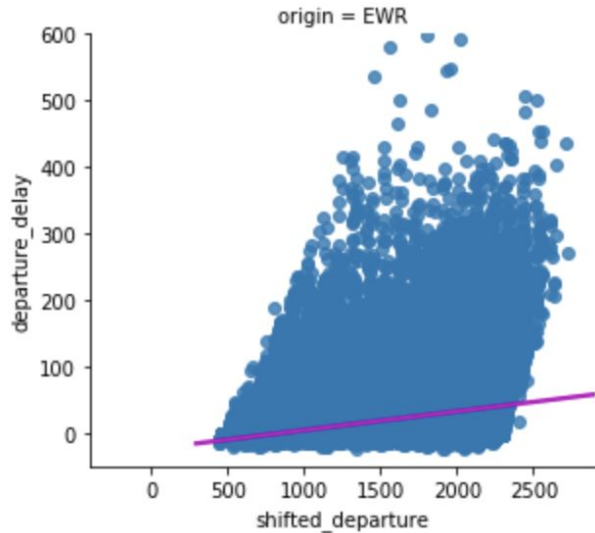

Let the data speak

Later **departure** times have bigger **delays**.

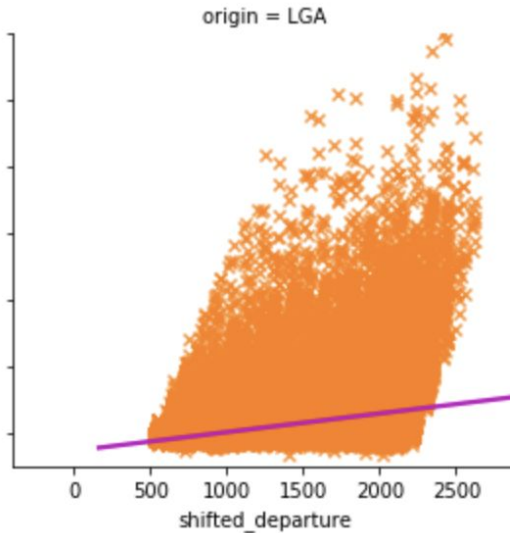

Let the data speak

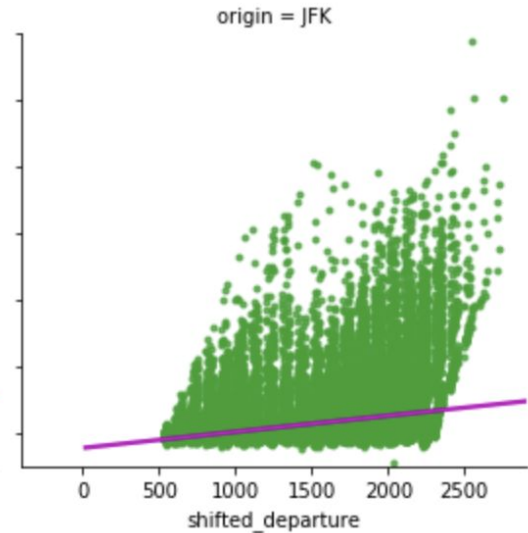

The bigger the **airport** the bigger the **delay** caused by **departure** time.

Slope 0.283
Total flights 145179

0.280
100663

0.242
72154

Let the data speak

Airline influences **delay**, but the interplay with the **airport** is complicated.

Percentages of delayed flights by carrier

carrier

WN	0.542602
FL	0.517591
F9	0.500739
UA	0.467530
EV	0.449564
VX	0.432953
YV	0.430427
9E	0.403788
B6	0.393612
DL	0.319517
MQ	0.318253
AS	0.316312
AA	0.315821
OO	0.310345
US	0.240708
HA	0.195846

dtype: float64

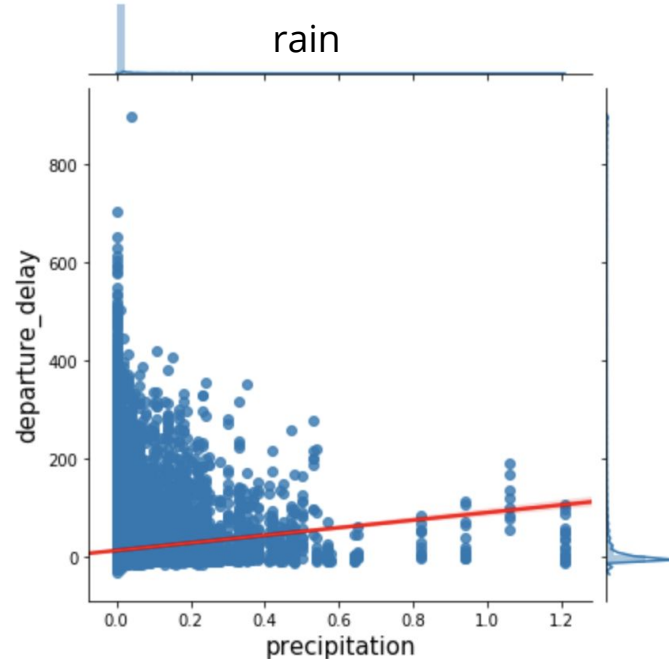

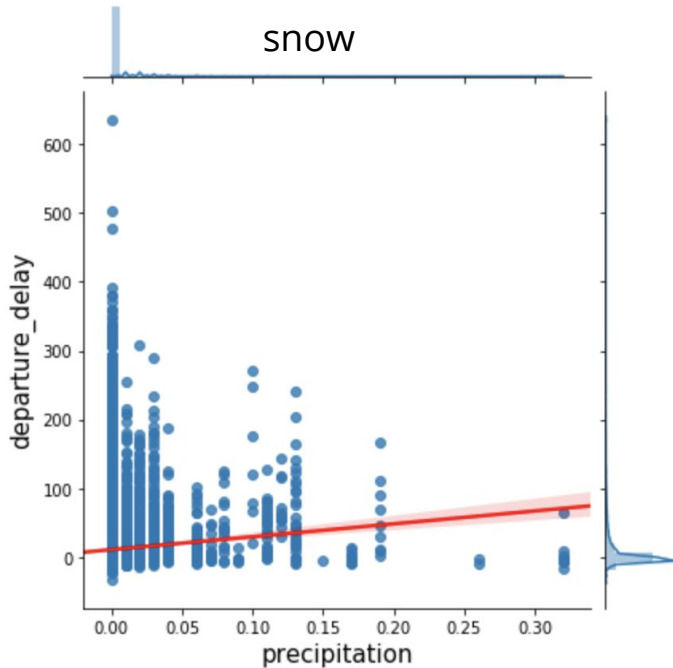

Let the data speak

Cold **temperature** and **visibility** issues cause longer **delays** (but not by much).

Let the data speak

As expected, the more **snow** the longer **delays** (the same for heavy **rain**).

Conclusions

If you are flying from NY and don't want to experience the dreaded delays:

- most importantly: **Wake up early!**
- **Don't wish for snow!** Why would you want to leave NY if it's snowing anyways?
- **Avoid Newark** if you really hate delays no matter how small, most flights from there have some delay and it gets crowded quicker.
- **Reconsider** carefully whether it is time **to let go your favourite airline.**
- **Consider** for how long you need to be in the **NY traffic** to get to your favourite airport (personal experience, the traffic study is for another time).
